Fractal Cities

Zipf's law

Radical Decay

Taylor's law

Spatial Yule Models

Formation Philosophy

Results

- ▶ Zipf's law and its formation
 - ▶ Zipf's law without fine-tuning: static mesoscopic
 - ▶ stationary distribution of dynamical processes for the sizes of groups of individuals
 - ▶ mesoscopic: cities
 - ▶ microscopic: individuals
- ▶ Gibrat's law and Taylor's law

Models that lead to Zipf's law

Some up-to-date models are really fascinating.

- ▶ Models with latent variables can lead to Zipf's law without fine-tuning by mixing together narrow distributions with very different means.(PRL 113, 068102 (2014))
 - ▶ static systems (no time dependence)
- ▶ The stationary distribution of dynamical processes for the sizes of groups of individuals
 - ▶ mesoscopic models at the scale of the groups (e.g., cities) Am. J. Phys. 58, 267 (1990). Variance that is not Gaussian but exponential Gaussian leads to the Zipf's law.
 - ▶ microscopic models at the scale of the individuals (e.g., dwellers)

Taylor's law

Spatial Yule
Models

Formation Philosophy

Results

- ▶ without the need to fine-tune their parameters to specific values
 - ▶ random multiplicative process, Am. J. Phys. 58, 267 (1990). *space independent*
 - ▶ Gibrat's law / proportionate random growth, Phys. Rev. E 57, 4811 (1998).
 - ▶ the interplay between intermittency and diffusion, Phys. Rev. E 58, 295 (1998).
- ▶ however they are coarse-grained descriptions of population dynamics and lack an explicit link to the underlying microscopic processes

Microscopic Models

- ▶ Stochastic processes describing the events experienced by an individual, namely births, deaths, and migrations, that ultimately determine the change in the size of a population.
 - ▶ Yule's and Simon's models: rich-get-richer, Phil. Trans. R. Soc. Lond. B 213, 21 (1925), Biometrika 42, 425 (1955).
 - ▶ Cluster growth and aggregation, Phys. Rev. E 58, 7054 (1998).
 - ▶ Reaction diffusion models: explore the role of intermittency in creating spatial inhomogeneities in agreement with Zipf's law, Phys. Rev. Lett. 79, 523
 - ▶ Preferential migration to large aggregates, Phys. Rev. Lett. 88, 068301 (2002).
 - ▶ Spatial explicit preferential attachment: the probability that a city grows is essentially assumed to be proportional to the size of the city.
 - ▶ network growth with redirection, Phys. Rev. X 4, 011008 (2014).
- ▶ Only for fine-tuned parameters to get $\gamma = 1$.

Radical Decay

Observations

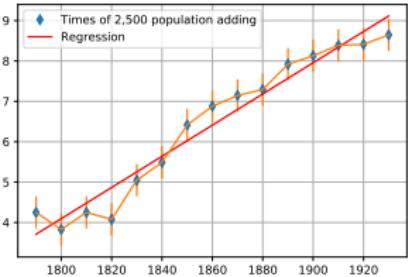

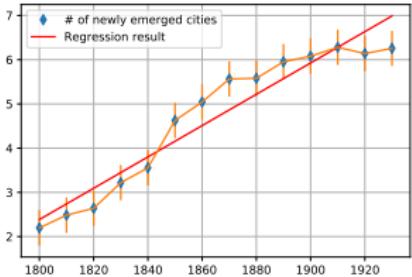

Figure: We take 2,500 as the study unit and get a) The emerging speed of cities in the United States, and b) the counts that 2,500 population are added to an existing city. Both slopes are around 0.04, $p < 0.0001$.

Zipf's law

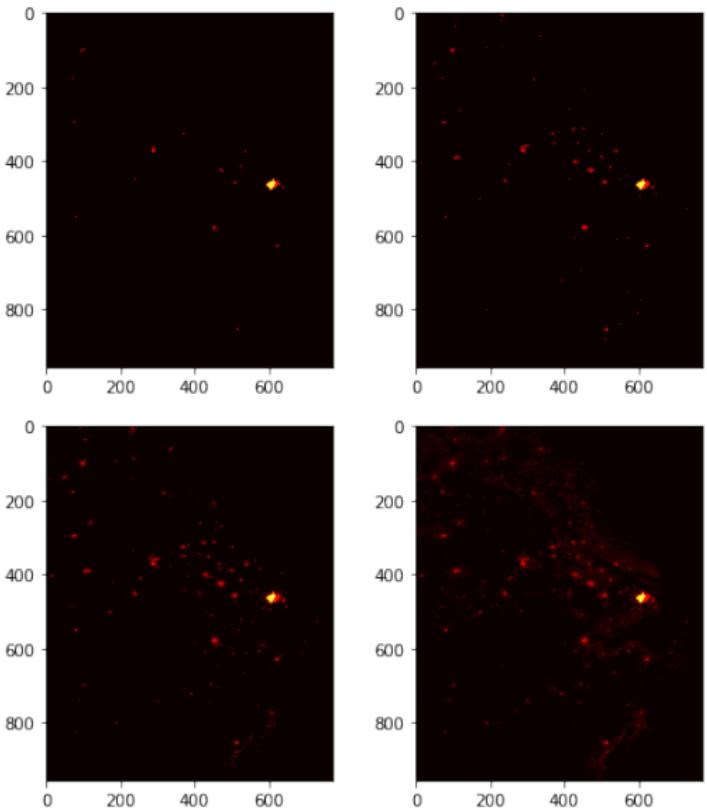

Radical Decay

Taylor's law

Spatial Yule
Models

Formation Philosophy

Results

- ▶ Scaling of inner- intra-city (area, population, infrastructure)
 - ▶ Gradient descent to the sum of two-dimensional normal distributions for a optimal locating problem lead to some scaling behavior.
- ▶ Interacting cities lead to Zipf's law and fractality of urban boundary.
- ▶ Asymptotic behaviors (standard cause of scaling) is far from reality.

Rules

The background is on a $L \times L$ grid space. The growing mechanism states as follows:

1. Growth rate per capita β_2 , and the growth rate for # of cities β_1 .
 - ▶ ignoring the correspondence to real-life time scale, the actual effective parameter the relative $\beta := \beta_2/\beta_1$.
2. The distance a ball lands a meta-population nearby as a constant, r , towards a random direction θ .
3. The *productive* balls are limited, with no more than N^* .

In all, this model relies on three parameters, the relative speed for city generation β , the diffusion rate r , and the size of the memory kernel N^* .
